CO1-ASSESSMENT TOOL 1 : APPLICATION BASED QUESTIONS

DSA0308-NATURAL LANGUAGE PROCESSING

NAME: S.Likiteshwar Reddy **REG NO:**192425120

1.Resume Extraction Using Regular Expression

1.We need to use python re model to extract the information from the resume

2.Create a sample resume data containing the candidate name,email,mobile number,skills,experience

3.Use regular expression to identify and extract the candidate name from resume

4.Search email and mobile number using respective patterns

5.Check resume for skills such like python,java,C++,SQL

6.Extract candidate experience from resume

7.Store that information in structured format ,by that structured format we can able to understand

8.Check the candidate experience has 2 years knowledge of python skill

9.If conditions are satisified mark that candidate as eligible for shortlist

10.Finally display the candidate complete profile ,skills,experience,eligibility status

2. Product Search System Using Regular Expressions

1.Import re module to perform keyword searches using regular expressions

2.Create list containing different product names such as laptop,books,accessories

3.Select keyword that customer wants to search from product list

4.Use exact matching to find product whose complete name matches to given word

5.Use prefix matching to identify products whose name starts with that specified keyword

6.Use suffix matching to find products whose name starts with given keyword

7.Apply partial matching to find products whose name starts with given keyword

8.We use case sensitive matching to find the product which are in uppercase and lowercase

9. Display the matching product names and calculate the total number of products found for each search.

10. If no products match the keyword, display a suitable message indicating that no products were found.

3. University Registration System Using Regular Expressions

1.import the re module to validate student information using regular expression

2.collect student reg no,college mail id,course code,mobile number

3.Create a separate regular expression pattern for each field based on required format

4.Chech whether the reg no contains the correct number of digits

5.Validate the institutional email to ensure that it follows the specified email format

6.Verify that course code contains the required letters and numbers

7.Check whether the semester value falls within the permitted range

8.Validate mobile number according to specified mobile number format

9.Use re.fullmatch() to ensure that entire input follows defined pattern

10. Display a clear validation message for each field, indicating whether the entered information is valid or invalid

11. If every field is valid, display Registration Successful. If any field is invalid, display Registration Failed

12. This process helps reduce incorrect entries and ensures that student information follows the university's registration requirements
